

Task

This is my task as you recommended me to work it using Native PHP.

1) running Task

- * you will find mysql please import 'Task.sql' its represent my database
- * put the folder in your '/var/www/html'.
- * In your browser put the url '**localhost/Task**' it will open the intro page with all the Category
 1. you can add,edit and delete category.
 2. you can list the book under any category.
 3. you can add a book under any Category you want ,edit and delete Book.

2)My Work

- * both files (book.php,category.php) are work as Controller they have all the logical operations.
- * both files (orm.php,appconf.php) are work as Model they have all the operations with database.
- *the rest of file represent View.
